

Palaeoverse Workshop: Palaeobiology Resources

Christopher D. Dean (he/him) *University College London*

Erin M. Dillon (she/her) *Smithsonian Tropical Research Institute*

Introduction

Aims

To provide information about useful resources for data handling as well as general programming and paleontology.

Approach

- Cover/summarize the workshop topics, as well as further general information.
- Too many to go over in detail – have highlighted important ones.
- Just a starting point – aim to add to what is gathered here.
- Are available on the workshop website.

Palaeoverse Resources Database

Feel free to access, use, and add anything we've missed!

Data Acquisition

Data Acquisition: Occurrence Databases

- Paleobiology Database – <http://paleobiodb.org>
- Geobiodiversity database – <http://giobiodiversity.com>
- Neotoma – <http://neotomadb.org>
- GBIF – <http://gbif.org>
- iDigBio – <http://idigbio.org>
- Neptune – <http://nsb.mfn-berlin.de>
- BioDeepTime – <http://doi.org/10.1111/geb.13735>
- Phylacine – http://megapast2future.github.io/PPHYLACINE_1.2/
- PARED – <http://paleo-reefs.pal.uni-Erlangen.de>

Data Acquisition: Occurrence Databases

Dillon, E.M., Dunne, E.M., Womack, T.M., Kouvari, M., Larina, E., Claytor, J.R., Ivkić, A., Juhn, M., Carmona, P.S.M., Robson, S.V. and Saha, A., 2023. Challenges and directions in analytical paleobiology. *Paleobiology*, 49(3), 377-393.

Supplementary Table 1. Examples of databases and online data portals used for paleobiological and (paleo)ecological research, along with their primary temporal, spatial, and taxonomic scope. N/A indicates that the corresponding information was either not applicable, undefined, or not readily available. The 'Modern' time period refers to last ~400 years unless otherwise specified. An additional list of databases has been compiled by PAGES at <https://pastglobalchanges.org/science/data/ext-databases>.

Name	Data Description	Temporal Scope	Spatial Scope	Taxonomic Scope	Website
AFORO (Shape Analysis of Fish Otoliths)	Sagitta otolith images and shape analysis	N/A	Global	Fish	http://aforo.cmima.csic.es/index.jsp
American Society of Mammalogists (ASM) Mammal Diversity Database	Taxonomic checklist of extant and recently extinct (since ~1500 CE) mammals	Modern	Global	Mammals	https://www.mammaldiversity.org/
Anthromes	Land cover data and maps showing global ecological patterns created by humans	Holocene – Modern	Global	N/A	https://anthroecology.org/datasets/
Arctic Data Center	Data and software repository for the Arctic section of National Science Foundation's Office of Polar Programs	Modern	Arctic	Multiple taxa	https://arcticdata.io/
Arctos	Biological specimen data	Modern	Global	Multiple taxa	https://arctosdb.org/
Biodiversity Atlas – India	Biodiversity data, including butterflies, moths, cicadas, mammals, birds, reptiles, amphibians, and odonates	Modern	India	Multiple taxa	https://www.bioatlasindia.org/bai-websites
Biodiversity Information Serving Our Nation (BISON)	Modern, historical, and fossil species occurrence data (subset of GBIF)	Precambrian – Phanerozoic	United States	Multiple taxa	https://bison.usgs.gov/
Biological and Chemical Oceanography Data Management Office (BCO-DMO)	Biological and chemical oceanography data	Modern	Global	N/A	https://www.bco-dmo.org/
BioTime	Species abundance time series data	Modern	Global	Multiple taxa	https://biotime.st-andrews.ac.uk
BugsCEP	Coleopteran occurrence and (paleo)ecological data	Quaternary	Global	Beetles	http://bugscep.com/
Catalogue of Life (COL)	Taxonomic classifications and catalogue of species	N/A	Global	Multiple taxa	https://www.catalogueoflife.org/

Data Acquisition: 3D Data and Trait Data

3D Data

- DigiMorph – <http://digimorph.org>
- Morphobank – <http://morphobank.org>
- Phenome10k – <http://www.phenome10k.org>
- Morphosource – <http://morphosource.org>

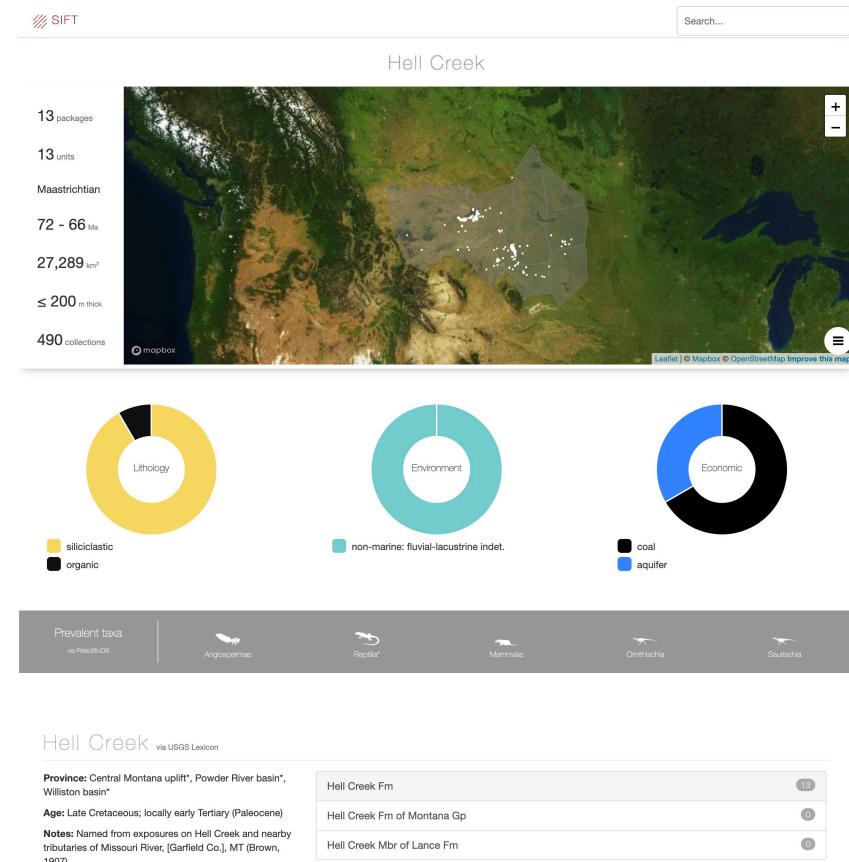

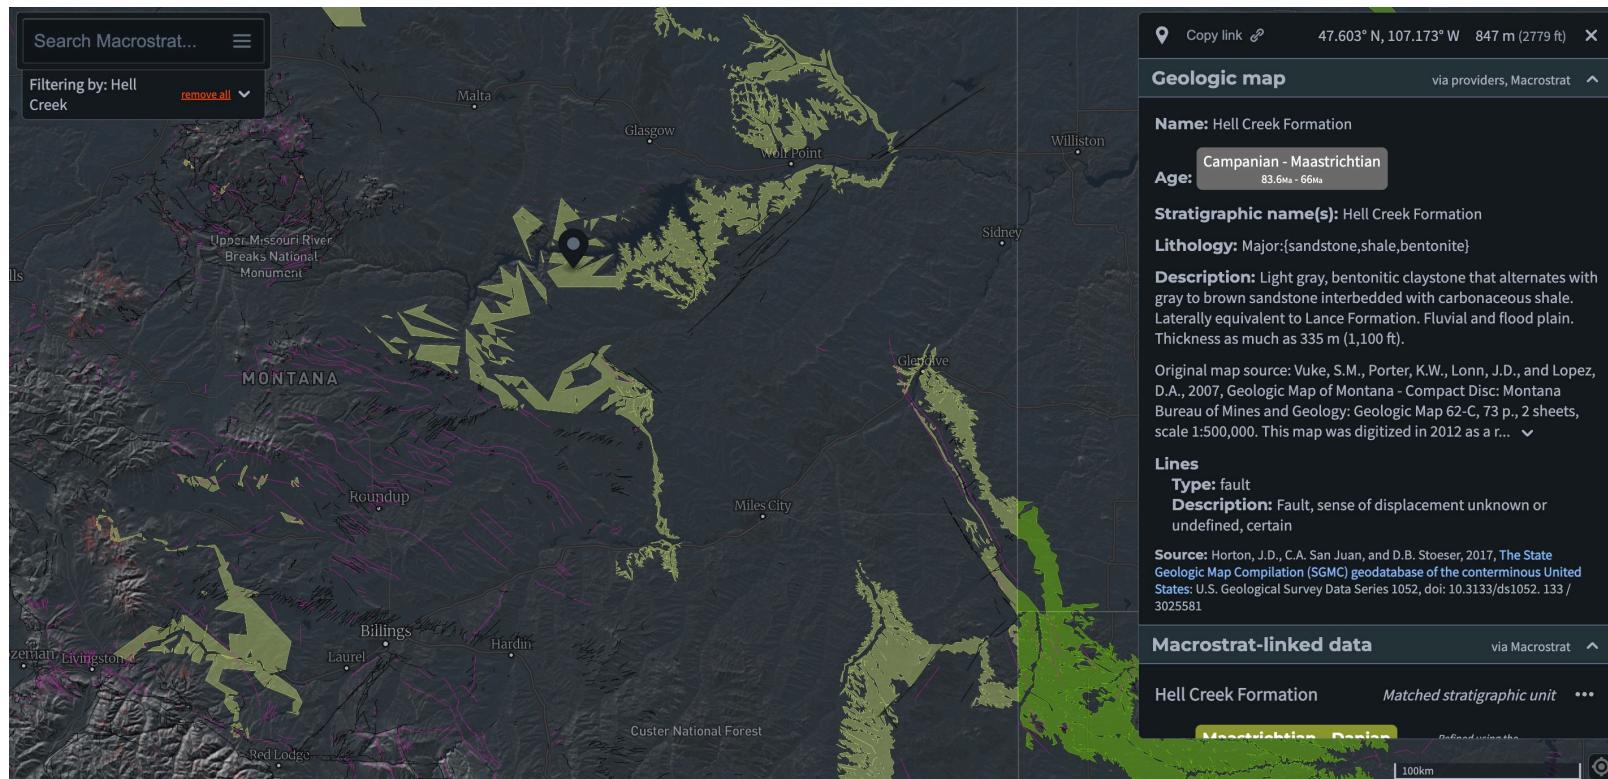

Trait Data

- Open Traits Network – <https://opentraits.org>
- Coral Trait Database – <https://www.coraltraits.org/>

Data Acquisition: Covariates

- Macrostrat – <http://macrostrat.org>
 - Provides both spatial outcrop and other associated information (e.g. lithology, palaeoenvironment, time interval, associated fossils etc.)
 - Mainly North America focused, but does include global information.
 - Accessed via API – but check out Bethany's poster!

Data Acquisition: Covariates

Geological Data

- Mindat – <https://www.mindat.org/>
- USGS Geologic Maps – <https://mrdata.usgs.gov/geology/state/>

Spatial Data

- WorldClim – <http://worldclim.org>
- Worldwide land cover – <http://esa-worldcover.org/en>
- Digital Elevation Maps –
https://www.usgs.gov/centers/eros/science/usgs-eros-archive-digital-elevation-global-30-arc-second-elevation-gtopo30?qt-science_center_objects=0#qt-science_center_objects
- Global Maximum Green Vegetation Fraction –
<https://doi.org/10.1175/JAMC-D-13-0356.1>
- PAGES list of databases –
<https://pastglobalchanges.org/science/data/databases>

Palaeogeography

- Deep Time Maps – <https://deephitemaps.com/about-us/> (paid)
- Paleomap Project – <http://www.scotese.com/> (Free!)

Data Acquisition: Museums

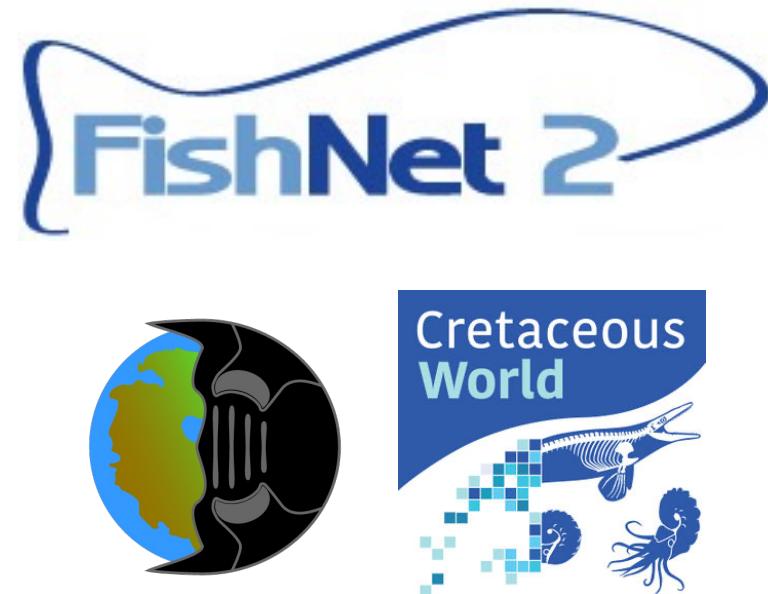

- Can be untapped resource of data
- Online specimen databases available
 - e.g. <http://www.fishnet2.net/>
- Broad digitization efforts
 - Digital Atlas of Ancient Life
<https://www.digitalatlasofancientlife.org/>
- Curators are the best!
- But... might have some accessibility issues.

Research article

Quantifying the dark data in museum fossil collections as palaeontology undergoes a second digital revolution

C. R. Marshall✉, S. Finnegan, E. C. Clites, P. A. Holroyd, N. Bonuso, C. Cortez, E. Davis, G. P. Dietl, P. S. Druckenmiller, R. C. Eng, C. Garcia, K. Estes-Smargiassi, A. Hendy, K. A. Hollis, H. Little, E. A. Nesbitt, P. Roopnarine, L. Skibinski, J. Vendetti and L. D. White

Data Acquisition: Packages

Paleobiology Database

- velociraptr: Fossil Analysis
 - Downloads and helps clean Paleobiology Database data.
- PaleobioDB
 - Same functionality as velociraptr, but as of recently no longer available on CRAN.

WORLDCLIM

- Can be directly obtained by `getData()` function of 'raster' package.

Macrostrat

- Check out Bethany's poster!

Package 'velociraptr'

October 12, 2022

Type Package

Title Fossil Analysis

Version 1.1.0

Author Andrew A. Zaffos

Maintainer Andrew A Zaffos <azaffos@email.arizona.edu>

Description Functions for downloading, reshaping, culling, cleaning, and analyzing fossil data from the Paleobiology Database <<https://paleobiodb.org>>.

The screenshot shows the CRAN package page for paleobioDB. At the top, there's a link to 'README.md'. Below it, there are several badges: 'Build Status' (green), 'codecov' (0%), 'downloads' (155/month), 'CRAN' (not published). The main title is 'paleobioDB'. Underneath, there's a section titled 'About' with the text: 'paleobioDB is a package for downloading, visualizing and processing data from Paleobiology Database.'

`getData {raster}`

R Documentation

Get geographic data

Description

Get geographic data for anywhere in the world. Data are read from files that are first downloaded if necessary. Function `ccodes` returns country names and the ISO codes

Usage

```
getData(name, download=TRUE, path="", ...)  
ccodes()
```

Arguments

`name` Data set name, currently supported are 'GADM', 'countries', 'SRTM', 'alt', and 'worldclim'. See Details for more info

Data Acquisition: Standards and Policies

- FAIR Guiding Principles (Findability, Accessibility, Interoperability, Reusability) – <https://fairsharing.org>
- TRUST Principles for digital repositories (Transparency, Responsibility, User focus, Sustainability and Technology) –
 - Lin, D., Crabtree, J., Dillo, I., Downs, R.R., Edmunds, R., Giaretta, D., De Giusti, M., L'Hours, H., Hugo, W., Jenkyns, R. and Khodiyar, V., 2020. The TRUST Principles for digital repositories. *Scientific Data*, 7(1), pp.1-5.

Data Preparation

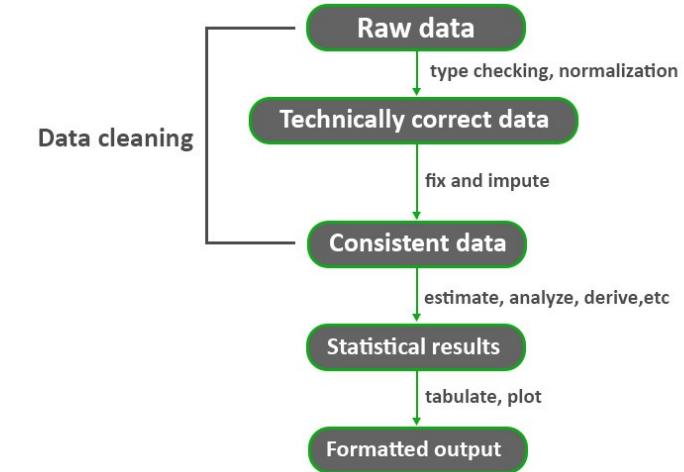

Data Cleaning

General Advice

- Data Cleaning in Data Science: Process, Benefits and Tools
 - <https://www.knowledgehut.com/blog/data-science/data-cleaning#what-is-data-cleaning-in-data-science?-%C2%>
- Tidy-ing Data – <https://www.dataone.org/webinars/tidy-ing-your-data-simple-steps-reproducible-research/>
- R Cheat Sheets – e.g.
<https://posit.co/resources/cheatsheets/>
- But... best practice is doing it!

Useful General Packages

- janitor
 - Automatic cleaning of column headings
 - Removes empty rows/columns and duplicate records.
- Data.validator
 - Create a report that shows which records don't fulfil a chosen criteria.
 - Quick checking of potential issues in dataset.

Data Preparation: Packages

- Palaeoverse (obviously!)
- CoordinateCleaner
 - Flags issues with co-ordinates and dating imprecisions.
 - Palaeo and modern data.
 - Example from the PBDB: 6.3% records are potentially problematic.
- Fossilbrush
 - Advanced version of 'tax_check' in palaeoverse.
 - Stratigraphic outlier detection.
 - Specifically for palaeo data.

Data Visualisation: Graphs

R Graph Gallery

Boxplot

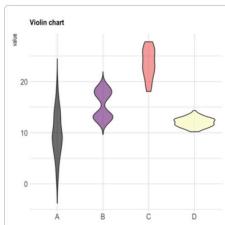

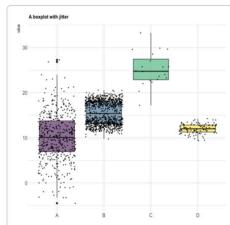

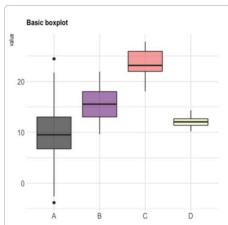

This is the [boxplot](#) section of the gallery. If you want to know more about this kind of chart, visit data-to-viz.com. If you're looking for a simple way to implement it in R or [ggplot2](#), pick an example below. Note: this [online course](#) on ggplot2 covers several geometries including [geom_boxplot](#)

Anatomy of a boxplot - [Explanation](#) - [Image source](#)

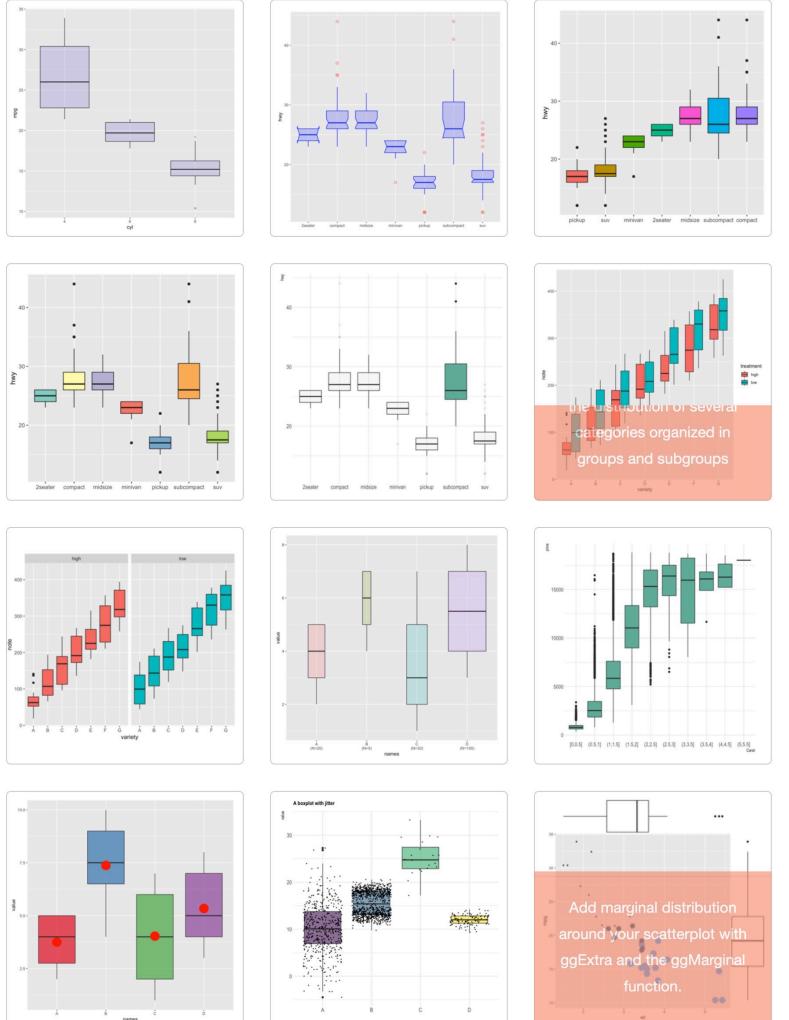

WARNING

Boxplot is probably the most commonly used chart type to compare distribution of several groups. However, you should keep in mind that data distribution is [hidden](#) behind each box. For instance, a normal distribution could look exactly the same as a bimodal distribution. Please read [more explanation](#) on this matter, and consider a [violin plot](#) or a [ridgeline chart](#) instead.

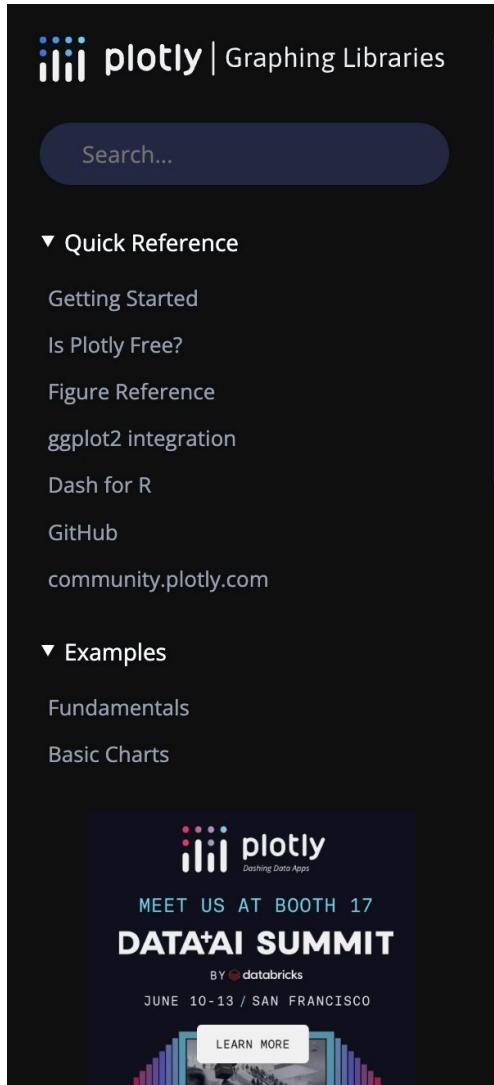

GGPLOT2

Boxplots are built thanks to the `geom_boxplot()` geom of [ggplot2](#). See its basic usage on the [first example](#) below. Note that [reordering groups](#) is an important step to get a more insightful figure. Also, showing individual data points with [jittering](#) is a good way to avoid hiding the underlying distribution.

Data Visualisation: Color

Colorhunt

- <https://colorhunt.co/>

The screenshot shows the Colorhunt website interface. On the left, there's a sidebar with filters: 'New', 'Popular' (selected), 'Month', 'Year' (selected), and 'All time'. Below that are 'Random' and 'Collection' buttons. A search bar at the top right says 'Search palettes'. The main area displays a grid of color palettes. Each palette has a heart icon indicating its popularity (e.g., 25,798, 22,468, 20,137) and a timestamp (e.g., 11 months, 10 months). A blue line connects the third palette in the second row to a detailed view on the right. This detailed view shows a larger version of the palette with four main colors: purple (#B1B2FF), blue (#AAC4FF), cream (#D2DAFF), and light (#EEF1FF). It also shows the RGB values for each color: rgb(177, 178, 255), rgb(170, 196, 255), rgb(210, 218, 255), and rgb(238, 241, 255). Below the colors are buttons for 'Like this palette?' (highlighted in black), 'Image', 'Link', and a timestamp '11 months'. At the bottom are color-coded buttons for 'Purple', 'Blue', 'Cream', 'Light', 'Pastel', 'Cold', and 'Sky'.

Data Visualisation: Color

Authors:

Mateusz Krzyżiński
Paweł Wojciechowski
Artur Żółkowski

RULES

INTUITIVENESS

Use intuitive colors. When choosing them, consider what associations do they evoke.
If possible, use colors that audience will associate with your data anyway.

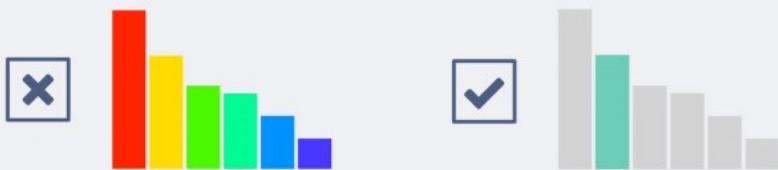

CLARITY

Use colors to make the data easier to read. Make sure your audience will be able to distinguish between the items shown in the visualization.

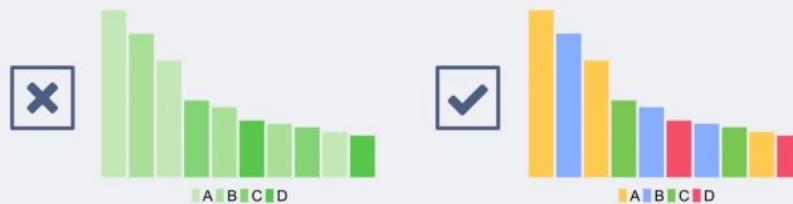

MODERATION

Use colors in moderation. For a simple dataset, a single color is preferable.
Use color as a strategic tool to highlight the important parts of your visual.

CLASSIFICATION

Don't use a gradient color palette for categories.
And the other way round - different colors for same measurement.

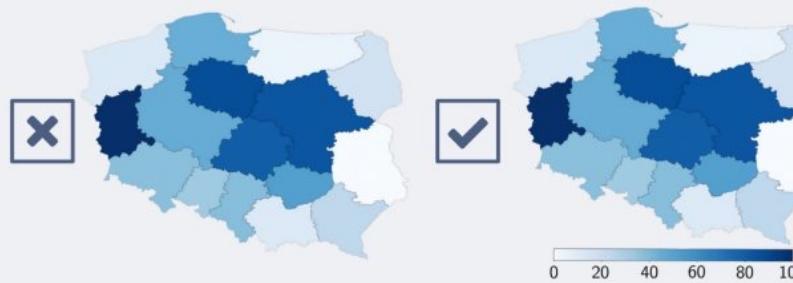

CONSISTENCY

Use colors consistently. Change colors if you want your audience to feel the change
for the specific reason, but never simply for the sake of novelty.

EXPLAINABILITY

Make sure to explain to your audience what exactly used colors mean.
Remember to create a color key.

Data Visualisation: Color

Authors:

Mateusz Krzyżiński
Paweł Wojciechowski
Artur Żółkowski

COLOR SCHEMES

Monochromatic - the simplest formula for harmony is monochromatic. Consists of different shades of one hue. Not a good choice if we want to highlight something.

Analogous - this scheme is composed of colors that are next to each other on the wheel. Usually they match up pretty well, making elegant and clear look.

Complementary - uses two colors which are opposite on the color wheel. With saturated colors makes very vibrant look. Try to tone down colors to avoid overvibrance, by adjusting saturation and lightness/darkness. Do not use with text with saturated colours.

Triadic - uses three colors that evenly spaced on the color wheel. Makes that none of colors is dominant and quite vibrant look.

Split-Complementary - variation of complementary scheme. Uses base color and two adjacent to its complementary color. Often this scheme is more pleasant to the eye than usual complementary scheme.

Tetradic - this scheme consists of four colors, two of them are complementary to other two. Choosing one color as dominant and the rest as accents, gives the best result.

Remember! Do not stick strictly to colors imposed by a scheme. These patterns are just starting points, you can create your own variations based on schemes above. Check also: paletton.com

PRO TIPS

The color grey is the most important color in data visualization.

The use of color should always be an intentional decision. Never let your tool make this important decision for you!

After creating your visualization, close your eyes and then look back at it, taking note of where your eyes are drawn first. Is it where you want your audience to focus?

When picking colors consider the connotations colors have in other cultures.
You can check: informationisbeautiful.net/visualizations/colours-in-cultures

Remember about color deficiency issues (color blindness).
You can check: projects.susielu.com/viz-palette

COLOR PALETTES

QUANTITATIVE DATA - SEQUENTIAL OR DIVERGING COLORS

Color is used show variations in the data. The palette contains a sequence of colors that clearly indicate which values are larger or smaller than which other ones (sequential scale). It can also visualize the deviation of data values in one of two directions relative to a neutral midpoint (diverging scale). Diverging scale can be viewed as two merged sequential scales.

Sequential scales

Blues

Viridis

YlOrBr

Diverging scales

PiYG

RdBu

BrBG

CATEGORICAL DATA - QUALITATIVE COLORS

Color is used to separate areas into distinct categories. The palette should consist of colors as distinct from one another as possible. The maximum number of categories that can be displayed is about 12 (practically speaking, probably fewer).

Colorblind

Set2

Accent

Pastell

All examples are available in Seaborn library. Check also: medialab.github.io/iwanhue/

Type	Title	Contact	Institution	Country	Description
Conference	The Palaeontological Association Annual Meeting 2024	Emma Dunne	Friedrich-Alexander-Universität (FAU) Erlangen-Nürnberg	Germany	The 68th Annual Meeting of the Palaeontological Association will be held at Friedrich-Alexander-Universität (FAU) Erlangen-Nürnberg, in the city of Erlangen in northern Bavaria, Germany. This will be the first time that the Annual Meeting will take place in Germany.
Conference	Progressive Palaeontology 2024	Kirsten Fleet	University of Bristol	UK	The annual, free-to-register Progressive Palaeontology (ProgPal) conference organised by students for students is being held in Bristol in June 2024. This conference is aimed at early career researchers to give them the opportunity to present their work and network in a relaxed environment amongst their peers.
Conference	7th International Palaeontological Congress	IP7 Organisers	Cape Town International Convention Centre	South Africa	The 7th International Palaeontological Congress (IP7) will be held in South Africa in 2025. The meeting will be held during the height of our very pleasant summer season at the Cape Town International Convention Centre (CTICC) between the 10 November - 3 December.
Conference	12th North American Paleontological Convention	Matt Friedman	University of Michigan	USA	Save the date for the upcoming 12th North American Paleontological Convention, which will be held at the University of Michigan from June 17-21, 2024. NAPC brings together professionals, graduate and undergraduate students, amateur paleontologists, and interested members of the public from all over the world. The meeting covers all branches of paleontology, including vertebrate, invertebrate, paleobiology, micropaleontology, paleo-related organic and inorganic geochemistry, paleoecology, paleoclimatology, and astrobiology, and provides a forum for exchanging research findings, defining future directions, and fostering related interactions within the paleontological community at large. We plan to feature a wide variety of symposia and topical sessions, along with associated workshops and other forums, varied field trips, and technical workshops. We are excited to offer a diverse program and look forward to welcoming you to the University of Michigan in 2024!
Lab	Conservatio Palaeobiology and Historical Ecology	Martin Zuschin	University of Vienna	Austria	We study modern environments and their very young fossil record to define ecological baselines for the differentiation of anthropogenic and non-anthropogenic change and to set realistic targets for the restoration of disturbed ecosystems. We use the older geologic record including now-extinct taxa to study biotic responses to environmental change that is beyond conditions observed today and to strengthen the ecological theory underlying conservation practice. For this purpose we concentrate on modern and fossil marine ecosystems and we use geological records (e.g. fossils, sediment cores, geochemical data among others) to study biotic responses to environmental disturbances.
Lab	Vertebrate Palaeobiology UCL	Philip Mannion	University College London	UK	We reconstruct patterns of ancient biodiversity through time and space in an attempt to better understand how past continental configurations and climatic changes constrained the evolution and distribution of ancient biodiversity, with relevance to predicting the long-term responses of climatically-threatened living organisms. This incorporates cutting-edge quantitative methods to elucidate the biogeographic history of fossil groups. Our work includes the characterisation of statistical relationships between deep time biodiversity and the geological biases that can obscure our understanding of macroevolutionary patterns, as well as subsampling and modelling approaches to ameliorate these biases.
Lab	PaleoLab USP-RP	Max Langer	University of São Paulo	Brazil	We study evolution, systematics and morphology of extinct organisms, with a special focus on vertebrates. We do lots of field works in many region of Brazil and other countries, collecting and describing new taxa. We are also interested in macroevolution, describing long-term patterns. PIs: Max Langer and Annie Hsiou.
Lab	Geozentrum Nordbayern	Wolfgang Kiessling	Friedrich-Alexander-Universität	Germany	In section Paleobiology and Paleoenvironments, we study the evolution of ecosystems over long timescales. We reduce the environmental factors which significantly influenced the emergence and disappearance of communities throughout Earth's history, alongside predicting the effects of modern day anthropogenic climate change on future ecosystems.
Lab	Bristol Palaeobiology Group	Emily Rayfield	University of Bristol	UK	The Bristol Palaeobiology Research Group includes eight members of academic staff together with large numbers of research fellows, postdocs, PhD students, and Masters students.
Lab	Computational Evolution	Tanja Stadler	ETH Zurich	Switzerland	The Computational Evolution group works on inferring the past state (i.e. the phylogenetic tree) of macroevolutionary processes, together with inferring the past speciation and extinction dynamics, particularly via the fossilized birth-death process.
Lab	Mapas Lab	Sara Varela	Universidad de Vigo	Spain	We are a group of scientists working on palaeoclimatology, paleontology, evolution, and ecology, investigating ancient life paleobiogeographic dynamics.

Welcome to the Palaeoverse Google Group!

This is a community space for palaeobiologists to share ideas and resources, advertise opportunities, and network with colleagues.

This is an unmoderated group, but please be kind to others. Harassment of individuals will result in removal from this space.

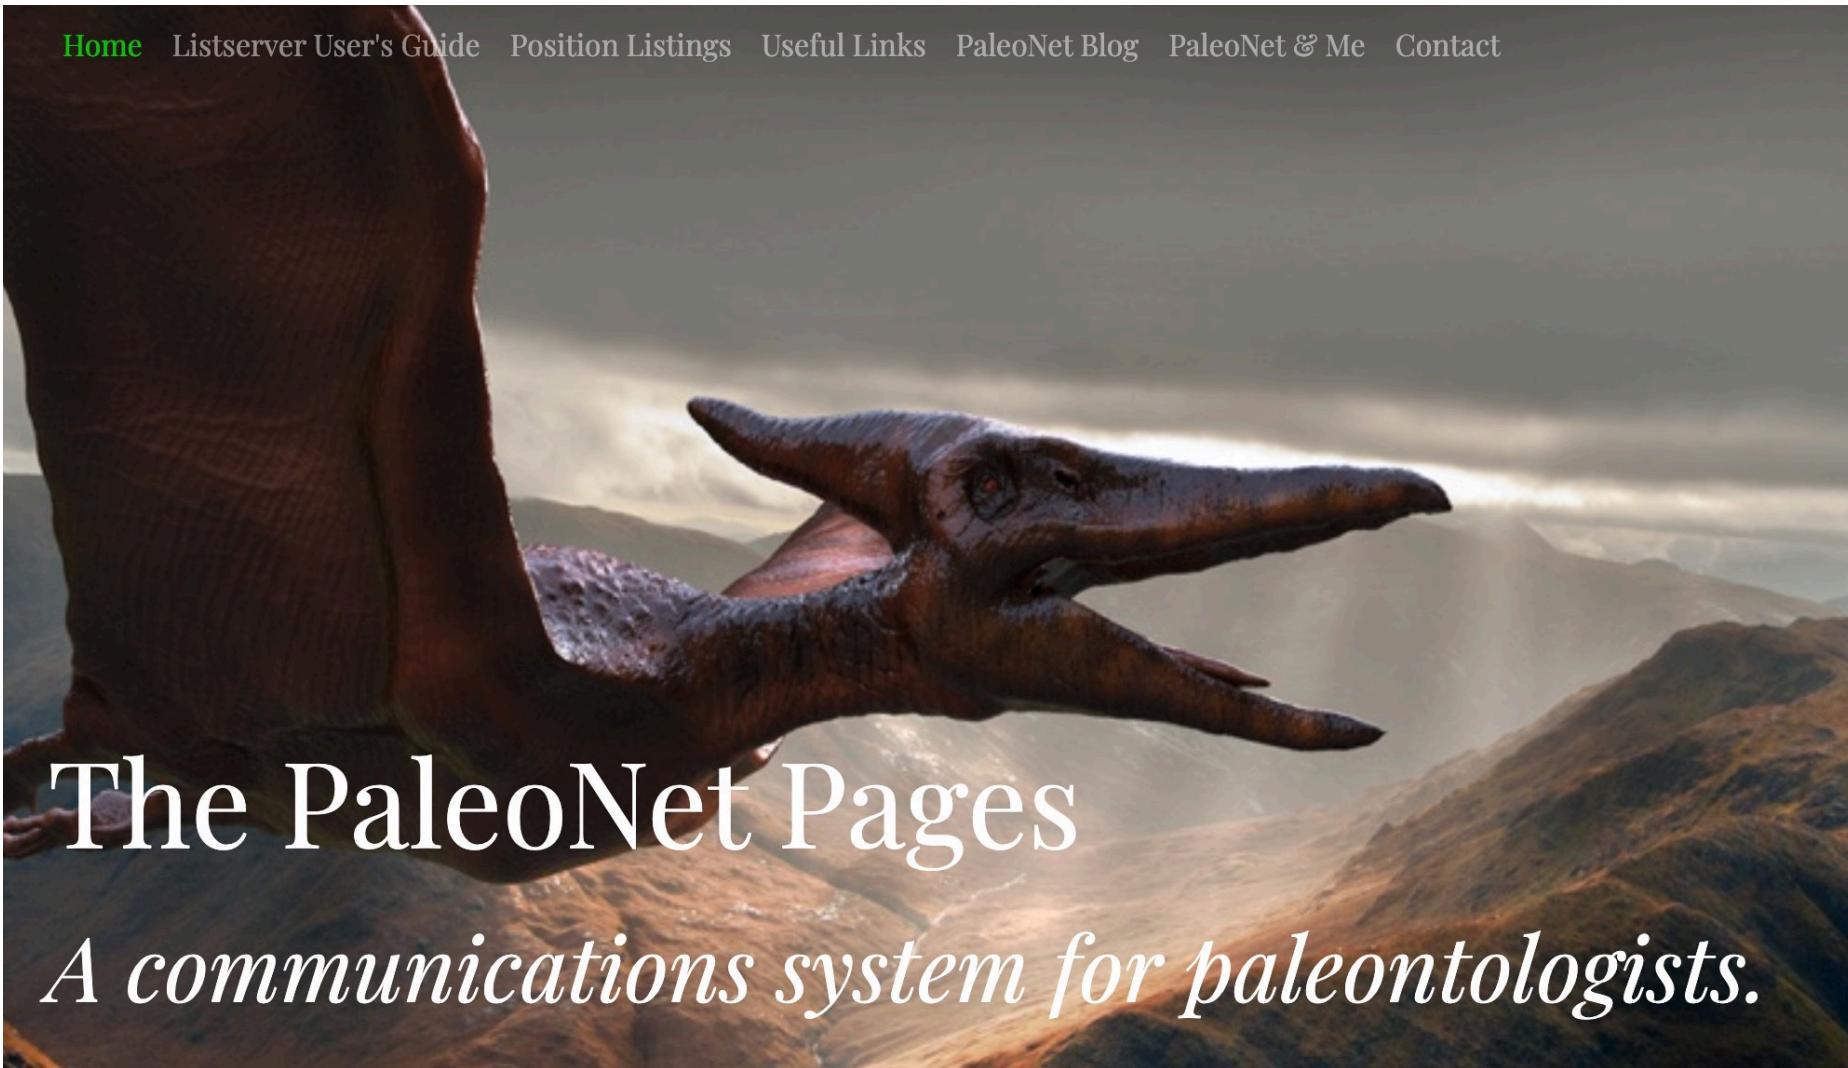

Questions regarding the palaeoverse R package are welcome here. Please raise specific issues or bugs via GitHub (<https://github.com/palaeoverse-community/palaeoverse>)

R for Palaeontologists

Learning how to code in one language or another is very on trend at the moment for people of all ages and within the scientific community it is no different. The inclusion of statistical programming into our technical arsenal allows palaeontologists to conduct and automate analyses that previously would have to be done manually and could potentially involve many different software packages. The only limit now being your imagination (and RAM).

What follows is a series of articles specifically designed to guide the novice programmer through the world of R (other languages are available). Starting with the basics of the terminology and syntax of the R language and how to create publication quality figures then moving through commonly used statistical (i.e. correlations and comparisons) and palaeontological (i.e. phylogenetic comparative methods) techniques along with the packages that make these analyses possible.

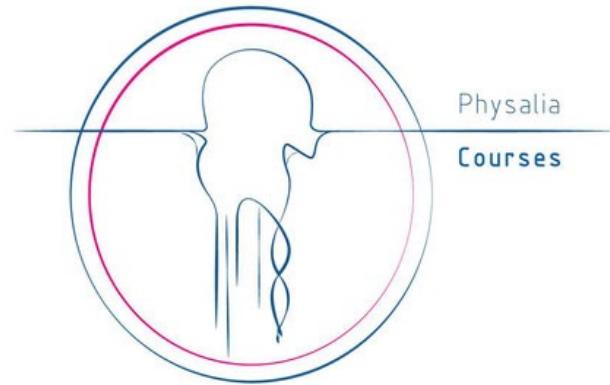

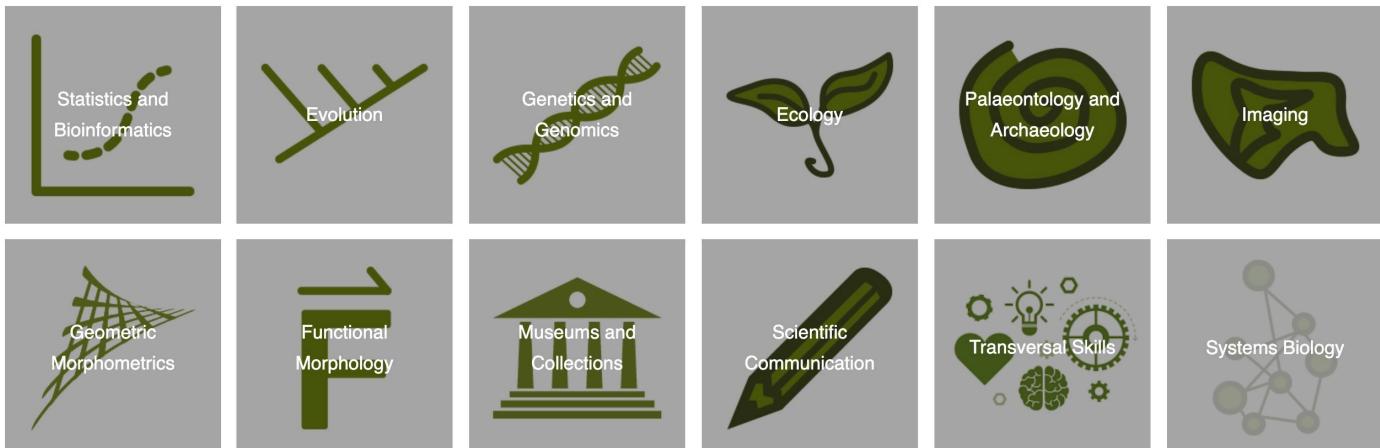

All the necessary datasets are provided and all code is presented in a way that can be directly copied and run in the R interface to produce the correct results or figures shown. Finally, if you are sitting there thinking that there is no way you could learn how to code, trust me it??s not as hard as it looks.

CRAN Task Views

- Lists and descriptions of helpful packages for specific fields/purposes.

Example: Phylogenetics

- <https://cran.r-project.org/web/views/Phylogenetics.html>

CRAN Task View: Phylogenetics

Maintainer: William Gearty, Brian O'Meara, Jacob Berv, Gustavo A. Ballen, Diniz Ferreira, Hilmar Lapp, Lars Schmitz, Martin R. Smith, Nathan S. Upham, Jonathan A. Nations

Contact: willgearty@gmail.com

Version: 2023-04-03

URL: <https://CRAN.R-project.org/view=Phylogenetics>

Source: <https://github.com/cran-task-views/Phylogenetics/>

Contributions: Suggestions and improvements for this task view are very welcome and can be made through issues or pull requests on GitHub or via e-mail to the maintainer address. For further details see the [Contributing guide](#).

Citation: William Gearty, Brian O'Meara, Jacob Berv, Gustavo A. Ballen, Diniz Ferreira, Hilmar Lapp, Lars Schmitz, Martin R. Smith, Nathan S. Upham, Jonathan A. Nations (2023). CRAN Task View: Phylogenetics. Version 2023-04-03. URL <https://CRAN.R-project.org/view=Phylogenetics>.

Installation: The packages from this task view can be installed automatically using the `ctv` package. For example, `ctv::install.views("Phylogenetics", coreOnly = TRUE)` installs all the core packages or `ctv::update.views("Phylogenetics")` installs all packages that are not yet installed and up-to-date. See the [CRAN Task View Initiative](#) for more details.

Overview

The history of life unfolds within a phylogenetic context, and phylogenetic trees (often shortened to “trees”) are developed to represent this evolutionary history. Comparative phylogenetic methods are statistical approaches for analyzing historical patterns along such phylogenetic trees. This task view describes R packages that (i) facilitate the handling, manipulation and analysis of phylogenetic trees; (ii) implement comparative phylogenetic methods; (iii) apply phylogenetic methods to specific disciplines. This is an active research area and much of the information is subject to change. Many important packages are not on CRAN: either they were formerly on CRAN and were later archived (for example, if they failed to incorporate necessary changes as R is updated) or they are developed elsewhere and are not yet available on CRAN. Such packages may be found on GitHub, R-Forge, [Bioconductor](#), or authors’ websites. At least ten packages start as `phy*` in this domain, including two pairs of similarly named packages (`phytools` and `phylotools`, `phylobase` and `phybase`); users are encouraged to read and distinguish carefully between package names.

Programming Resources

Example: Phylogenetics

Working with trees in R

Getting trees into R

- [phylobase](#) and its lighter weight sibling [ncl](#) can use the [Nexus Class Library](#) to read NEXUS, Newick, and other tree formats.
- [treebase](#) can search for and load trees from the online tree repository [TreeBASE](#).
- [RNXML](#) can read, write, and process metadata for the [NeXML](#) format.
- [TreeTools](#) can read trees from external files in [TNT](#) format and NEXUS format, including extensions to the Nexus format not supported by [ape](#), and metadata from [MorphoBank](#).
- [ips](#) can load trees from [BEAST](#), [MrBayes](#), and other phylogenetics programs. This package can be used to parse the node support and other values from BEAST or MrBayes output.
- [phylotate](#) can read and write [ape](#)-compatible phylogenetic trees in NEXUS and Newick formats, while preserving annotations.
- [phext2](#) can read and write various tree formats, including simmap formats.
- [rotl](#) can pull in a synthetic tree and individual study trees from the [Open Tree of Life](#) project.
- The [treearr](#) package can read trees in Newick, Nexus, New Hampshire eXtended format (NHX), jplace and Phylip formats and data output from BEAST, EPA, HyPhy, MrBayes, PAML, PHYLDOLG, pplacer, r8s, RAxML and RevBayes.
- [phylogram](#) can convert Newick files into dendrogram objects.
- [dendextend](#) can manipulate such dendrogram objects.
- [phytools](#) can read and write trees in simple Newick and Nexus format, as well as "simmap" trees with an encoded discrete character.

Tree manipulation

- [phylobase](#) has functions for traversing a tree (e.g., getting all descendants from a particular node specified by just two of its descendants).
- [geiger](#) can prune trees and data to an overlapping set of taxa. It can also be used to perform branch length scaling using ACDC; Pagel's (1999) lambda, delta and kappa parameters; and the Ornstein-Uhlenbeck alpha parameter (for ultrametric trees only). It can also be used to prune extinct taxa.
- [TreeTools](#) has functions to quantify and manipulate tree shape and balance, including the application of constraints; and to measure the phylogenetic information content of trees.
- [Rogue](#) identifies wildcard taxa, generating more informative summary trees.
- [tidytree](#) can convert a tree object to a tidy data frame and has other tidy approaches to manipulate tree data.
- [evobiR](#) can do fuzzy matching of names (to allow some differences).
- [SigTree](#) finds branches that are responsive to some treatment, while allowing correction for multiple comparisons.
- [dendextend](#) can manipulate dendograms, including subdividing trees, adding leaves, and more.
- [apeX \(archived\)](#) can handle multiple gene DNA alignments making their use and analysis for tree inference easier in [ape](#) and [phangorn](#).
- [aphid](#) can weight sequences based on a phylogeny and can use hidden Markov models (HMMs) for a variety of purposes including multiple sequence alignment.
- [phangorn](#) and [TreeSearch](#) can perform tree rearrangements (NNI, SPR, and TBR).
- [paleotree](#) has functions for manipulating trees based on sampling issues that arise with fossil taxa as well as more universal transformations.
- [dendextend](#) can manipulate dendograms, including subdividing trees, adding leaves, and more.
- [castor](#) can be used to manipulate extremely large trees (up to millions of tips).
- [phytools](#) can slice a tree at a pre-specified point, add taxa randomly to a tree, add species to genera, bind a single tip to a tree or two trees together, collapse clades on a tree using a clickable interface, perform midpoint rooting, paint a user-specified discrete character regime onto a tree to create a "simmap" object by various methods, convert a tree with a mapped character into a simple "phylo" object with unbranching nodes or a root edge into a single unbranching node, and other things.

Tree visualization

- [ape](#), [adephylo](#), [phylobase](#), [phytools](#), [ouch](#), and [dendextend](#) have functions for plotting trees; several of these have options for branch or taxon coloring based on some criterion (ancestral state, tree structure, etc.). In addition, [phytools](#) has substantial functionality to plot comparative data at the tips of the tree, graph the results of comparative analyses, and plot co-phylogenies.
- [paleoPhylo](#) and [paleotree](#) are specialized for drawing paleobiological phylogenies.
- [viper](#) can be used to annotate phylogenies with branch support, HPD intervals, and more.
- The popular R visualization package [ggplot2](#) can be extended by [ggtree](#) and [ggtreeExtra](#) to visualize phylogenies, and a geological timescale can be added using [deeptime](#).
- [strap](#) can be used to add a geological timescale to a phylogeny, along with stratigraphic ranges.
- [idendifR](#) can be used to interactively explore trees (as dendograms).
- [phylocanvas](#) is a widget for "htmlwidgets" that enables embedding of phylogenetic trees using the phylocanvas javascript library.
- [ggmuller](#) allows plotting a phylogeny along with frequency dynamics.
- [RPANDA](#) can be used to plot the spectral density and eigenvalues of a phylogeny.
- [diversitree](#) has an unexported function called "plot2.phylo()" which allows for the production of very lightweight PDF outputs of speciose trees (can be called via `diversitree:::plot2.phylo()`).
